

Lecture 8

Arousal & Sleep

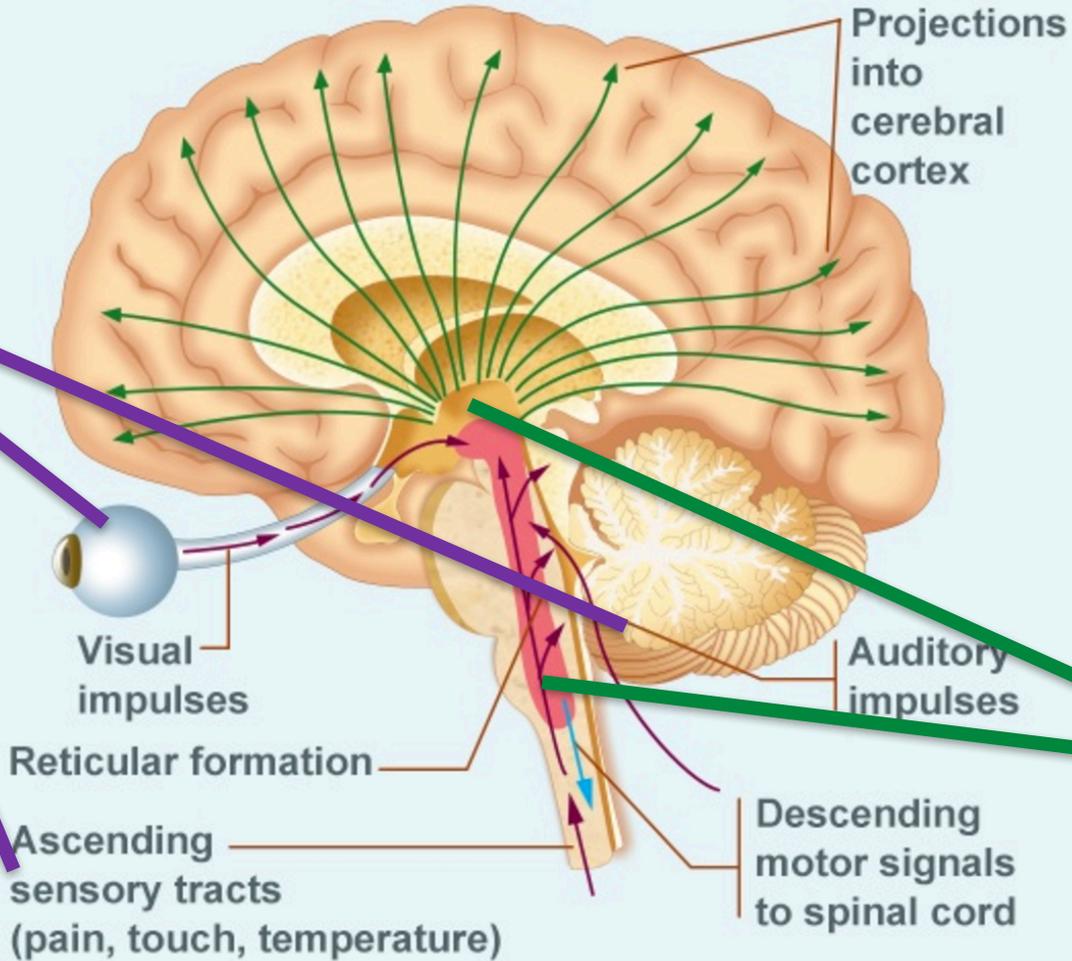

Cogs17 * UCSD

Arousal in the Brain

Reticular Activating System

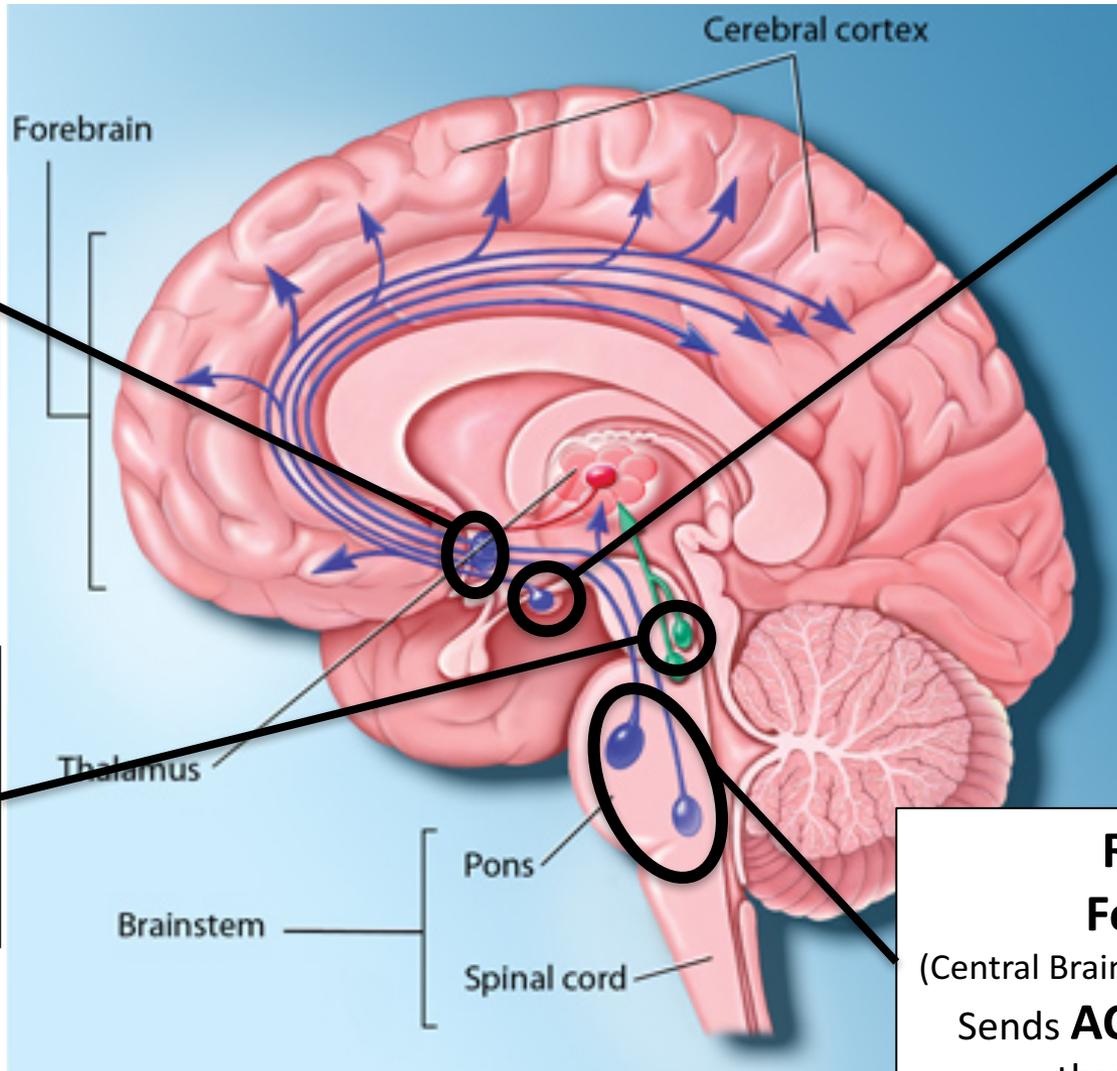

Buzzle.com

Stimulated by sensory input

Also initiated, maintained endogenously

Arousal in the Brain

Basal Forebrain

Delivers **ACh** throughout cortex

Lateral Hypothalamus

releases **Orexin**, helps maintain arousal in these other systems, based on body conditions

Locus Coeruleus

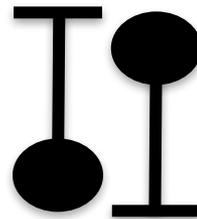

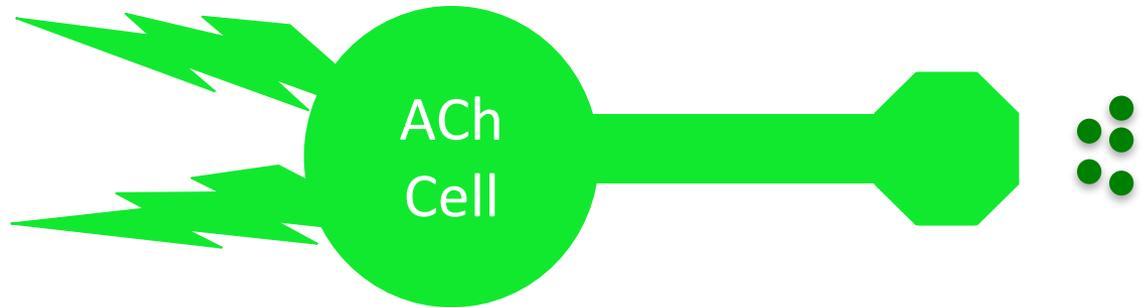

("Dark Blue Place")
Releases **NE** for Vigilance, Alerts memory

Reticular Formation

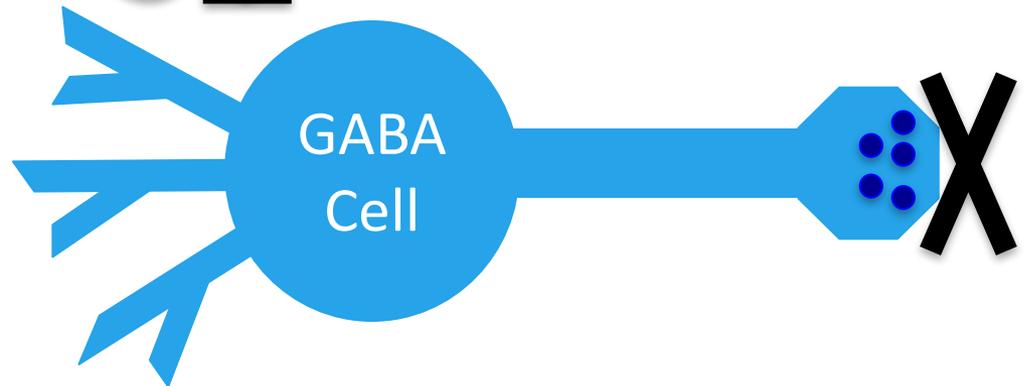

(Central Brainstem, Lateral to Raphe)
Sends **ACh & Glutamate** throughout brain

How does Caffeine help you wake up?

Basal Forebrain

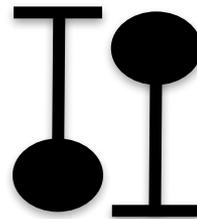

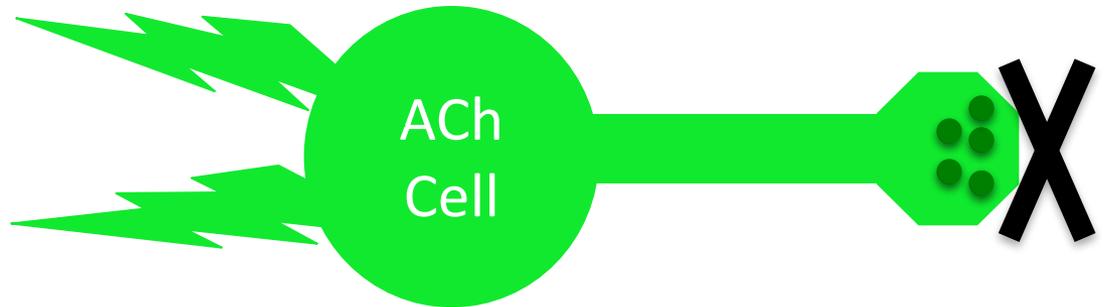

Opponent Systems –
If one active, other inactive

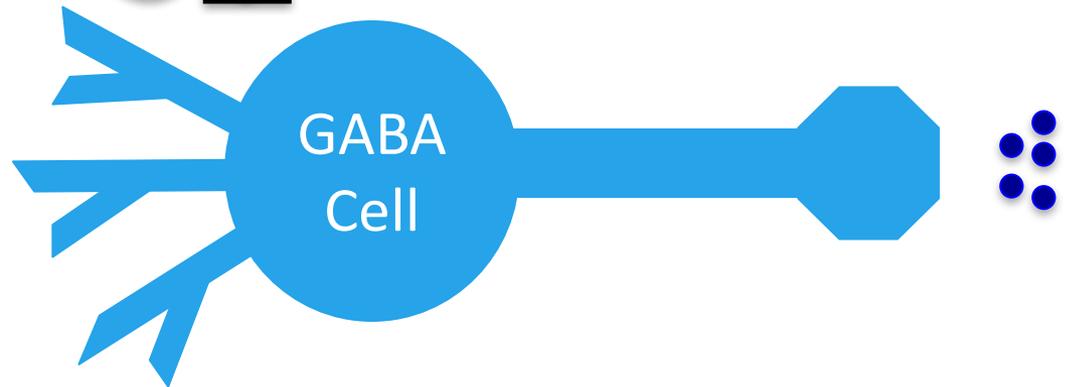

How does Caffeine help you wake up?

Basal Forebrain

Opponent Systems –
If one active, other inactive

How does Caffeine help you wake up?

Basal Forebrain

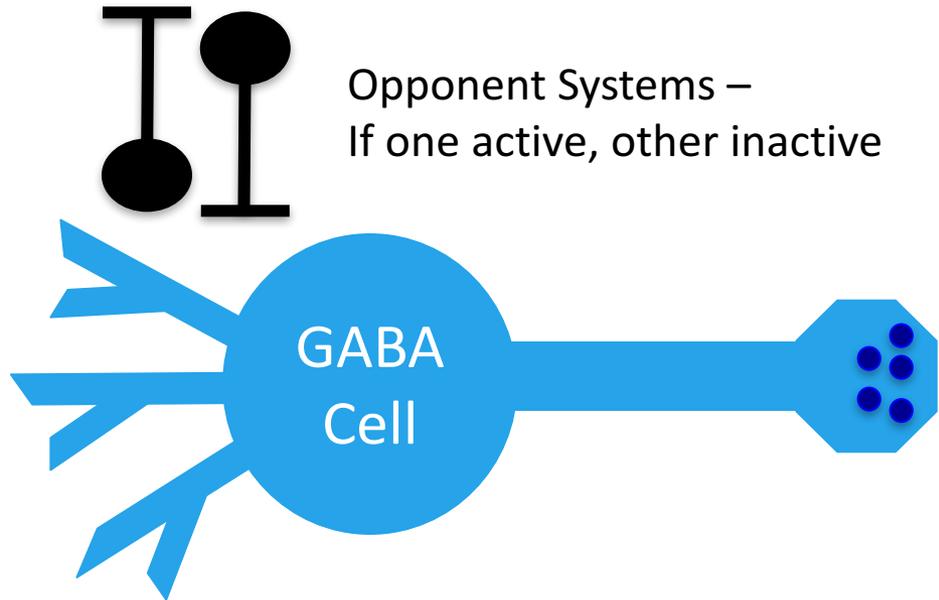

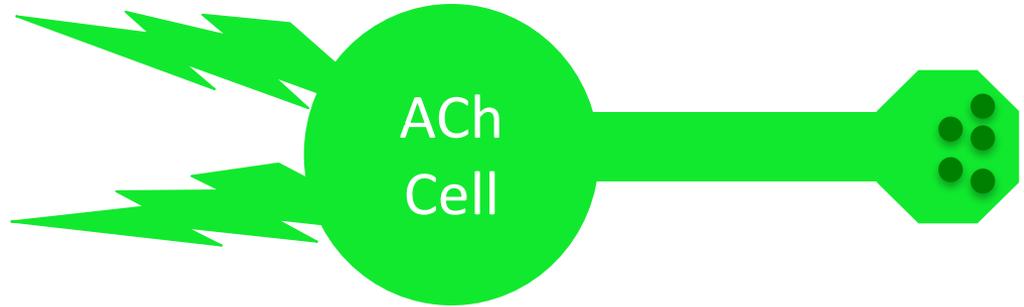

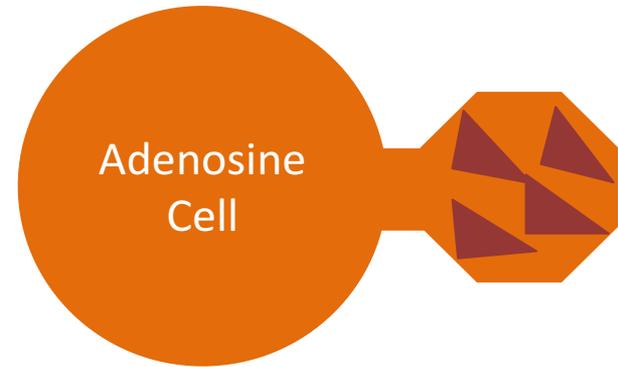

Adenosine
Cell

Adenosine 
(a metabolic byproduct)
builds up in cells
during the day

ACh
Cell

Opponent Systems –
If one active, other inactive

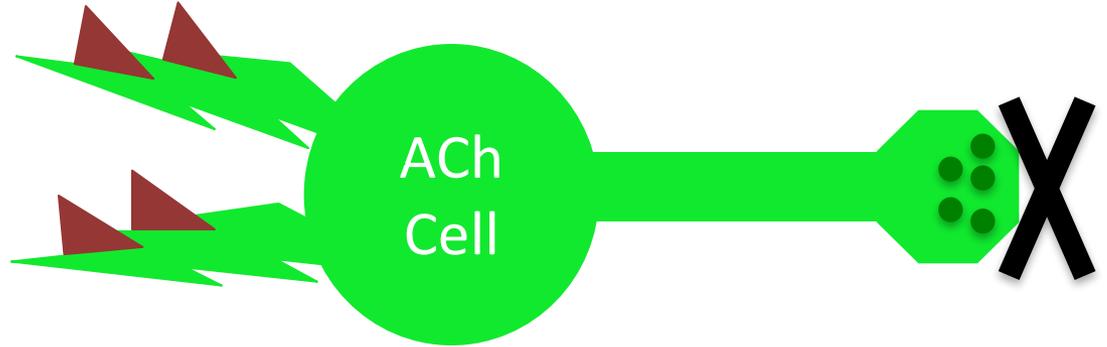

GABA
Cell

How does Caffeine help you wake up?

Basal Forebrain

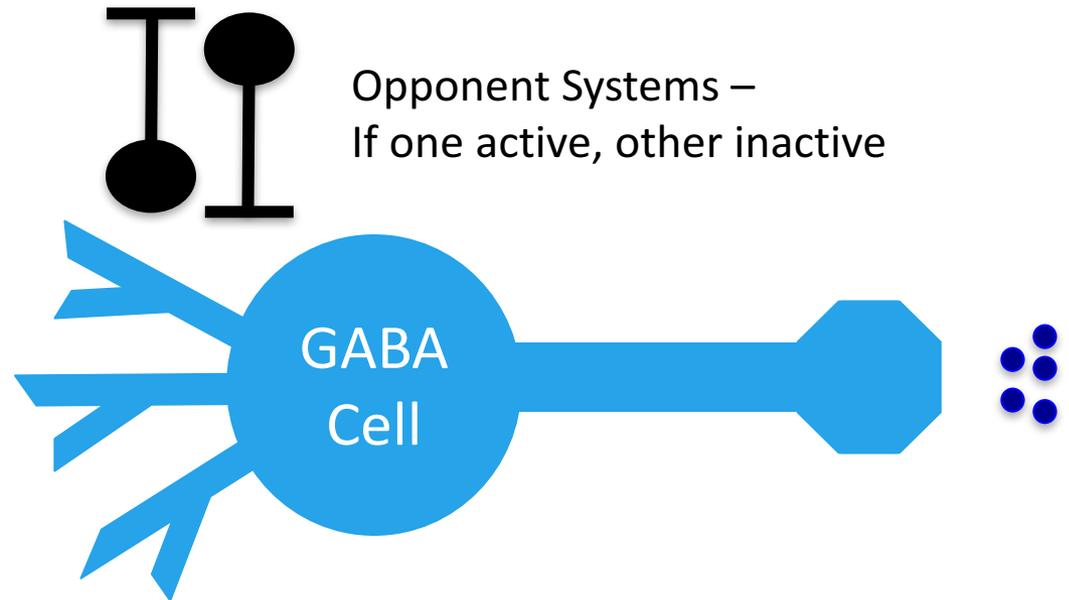

Adenosine Cell

Adenosine 
(a metabolic byproduct)
builds up in cells
during the day

Its release
Inhibits ACh cells
in Basal Forebrain,
allowing **GABA** system
to dominate
>> **Sleep**

Opponent Systems –
If one active, other inactive

How does Caffeine help you wake up?

Basal Forebrain

NOTE: ACh cell is also simultaneously being excited by other arousal inputs

Adenosine Cell

ACh Cell

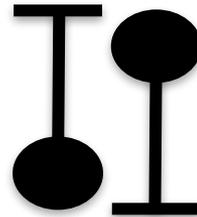

Caffeine 

(crosses blood-brain barrier)

BLOCKS Adenosine receptor sites

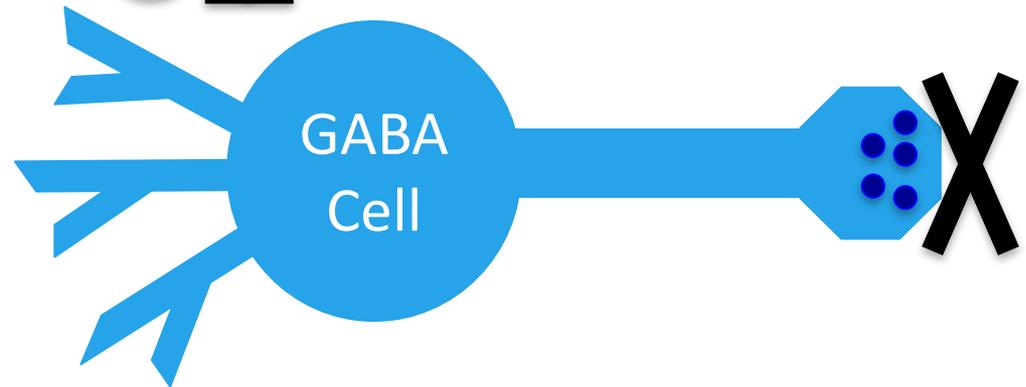

But does NOT inhibit ACh cells

So ACh system active, which suppresses GABA system
>> **Awake!**

Opponent Systems –
If one active, other inactive

GABA Cell

EEG - Electro-Encephalogram

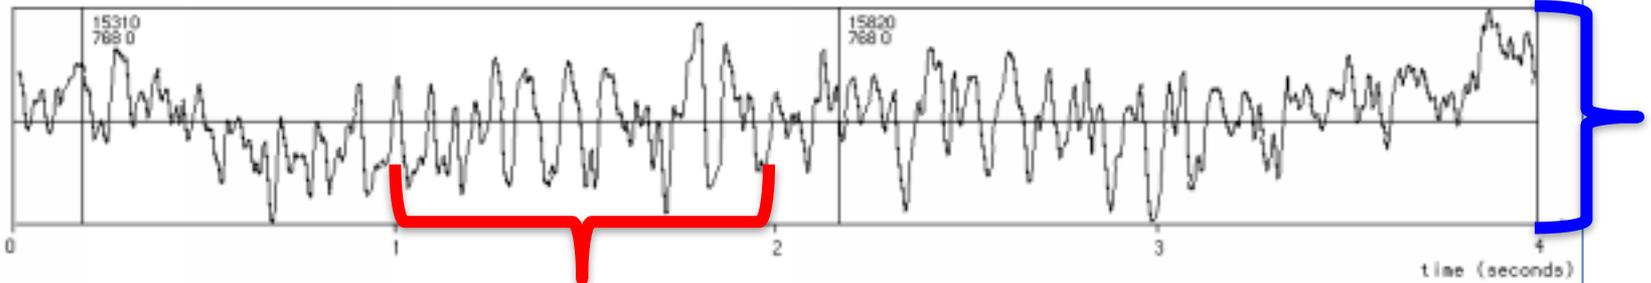

Gross average change in electrical potentials in area under electrode

Amplitude = Voltage

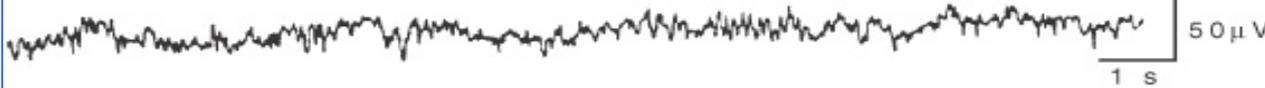

Frequency = Cycles per second (Hz)

Sample EEG Recording

Time series

Awake: low voltage-random, fast

Awake

Beta (18-24 Hz)

Awake: 8 to 12 cps- alpha waves

Alert & Relaxed

Alpha (8 -12 Hz)

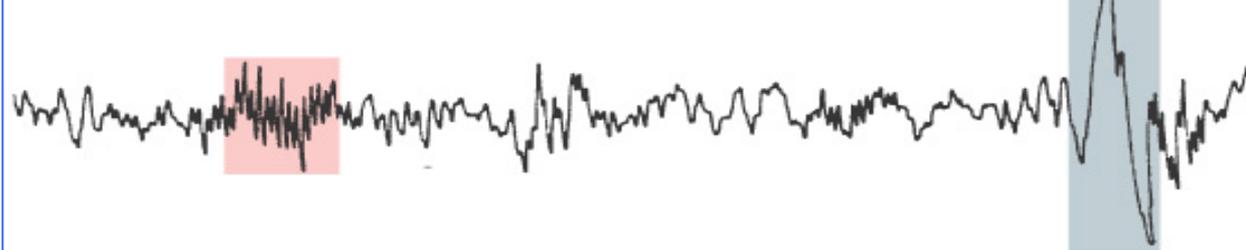

Stage 1: 3 to 7 cps- theta waves

Stage 1

Theta (4-7 Hz)

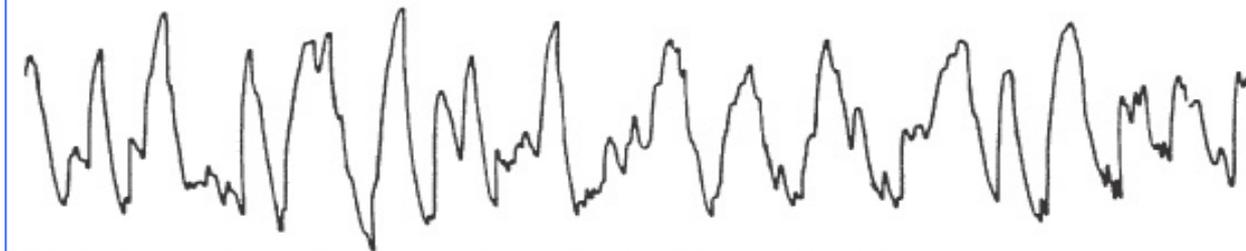

Stage 2: 12 to 14 cps- sleep spindles and K complexes

Stage 2:

Theta w/Spindles
and K-Complexes

Deep sleep: 1/2 to 2 cps- delta waves >75 μV

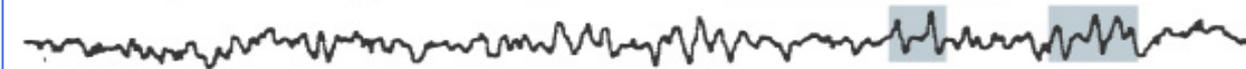

Stage 3 & 4

“Slow Wave Sleep”

Delta (< 4 Hz)

3=<50% 4=>50%

REM sleep: low voltage-random, fast with sawtooth waves

REM

Variable EEG: 12-28 Hz

Desynchronized

Synchronized

Desynchronized

Awake

Beta (18-24 Hz)

Alert & Relaxed

Alpha (8 -12 Hz)

Stage 1

Theta (4-7 Hz)

Stage 2:

Theta w/Spindles
and K-Complexes

Stage 3 & 4

“Slow Wave Sleep”

Delta (< 4 Hz)

3=<50% 4=>50%

REM

Variable EEG: 12-28 Hz

Desynchronized

Lob many stones into a pond...

Lob one stone into a pond...

Synchronized

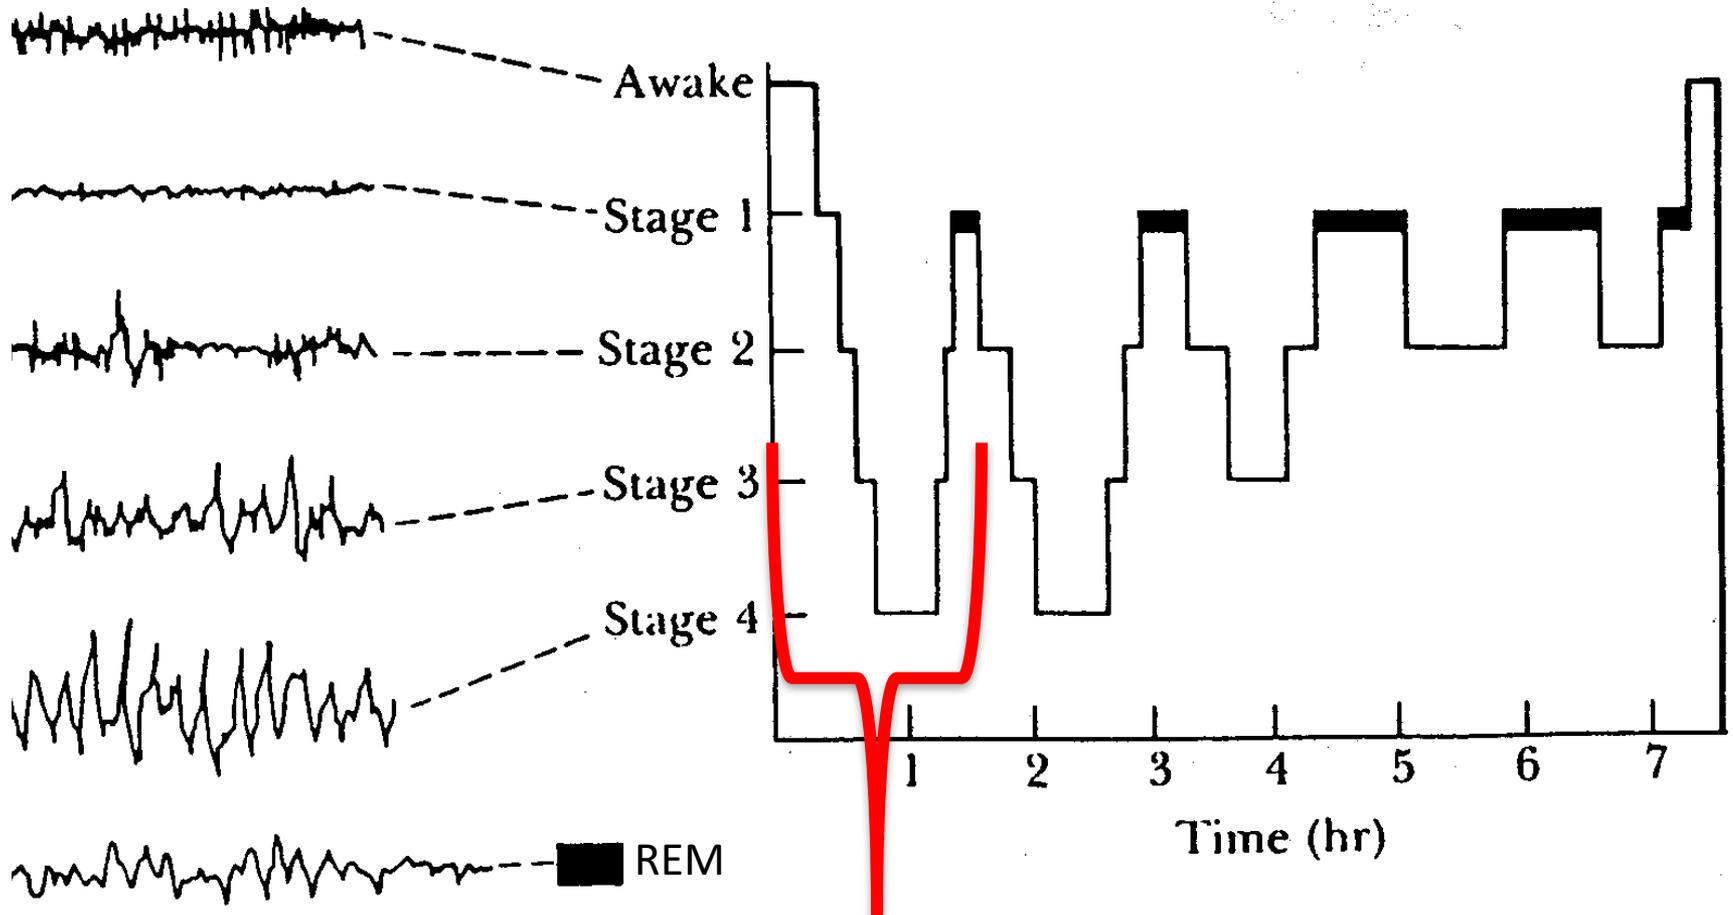

Lob *imaginary* stones into a pond...

Desynchronized

Sleep Cycle

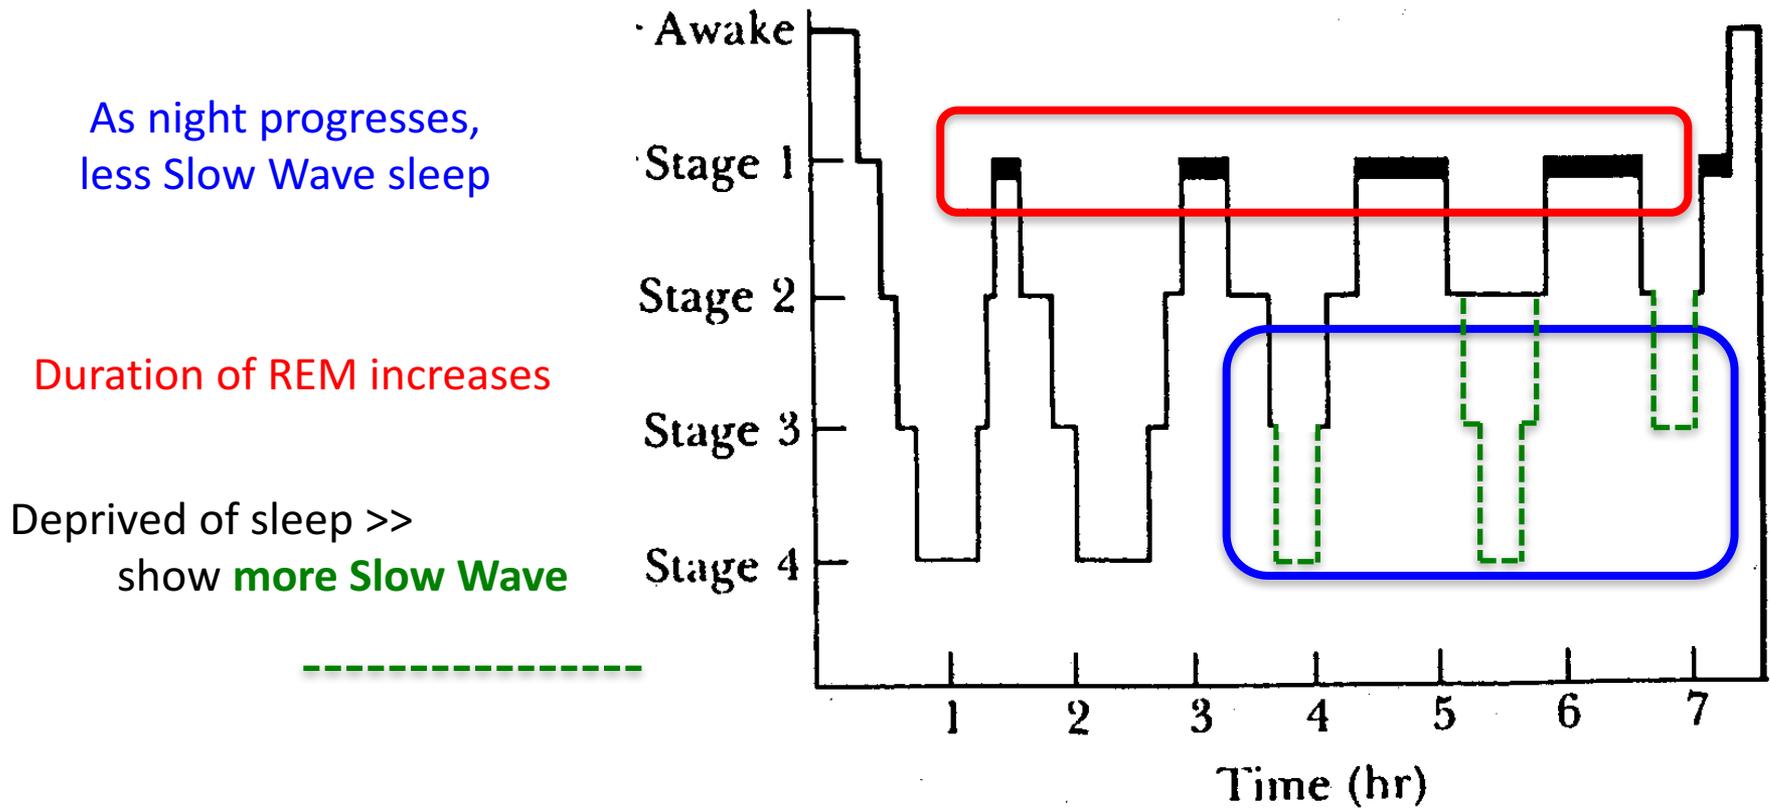

~ 90 Minute Cycle: Stage 1, 2, 3, 4, 3, 2, REM

~90 Min

Sleep Cycle

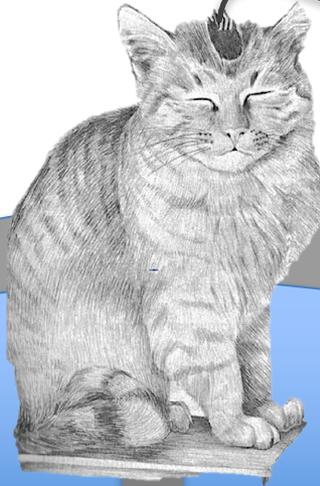

~ 90 Minute Cycle: Stage 1, 2, 3, 4, 3, 2, REM

Sleep Deprivation >> Lethargy, poor concentration, irritability;
Decreased resistance to infection

REM Deprivation

Cat on pedestal in tank – recording EEG

When enters REM,
Atonia causes cat to fall in,
wake up

So, selectively deprive it of REM sleep

REM-deprived cat displays....

Irritability

Poor concentration

Hallucinations

Death!

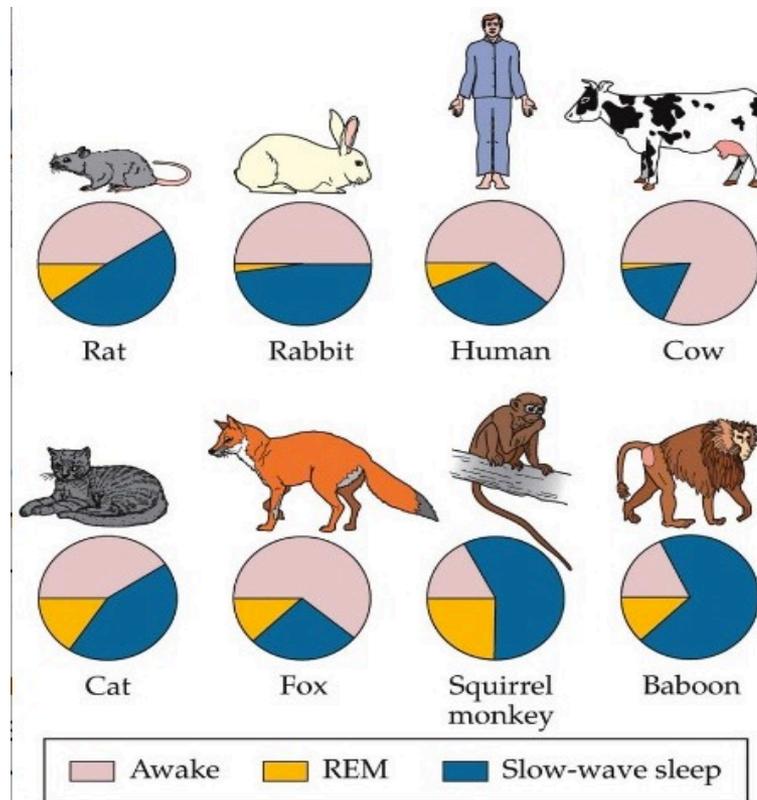

If REM deprived, will show

REM rebound

- REM periods lengthen

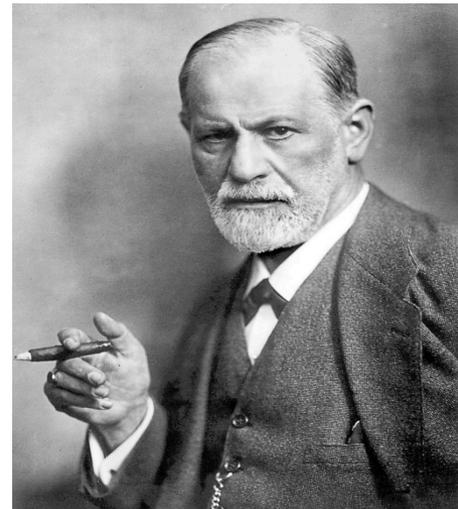

Functions of Sleep & REM ???

- Controversial!
- Sleep IS restorative
 - Engage in critical metabolic processes, process waste, etc
 - But, then why do some animals (e.g. prey) sleep only a few hours while others require so much more (e.g. predators) ?

Functions of Sleep & REM ???

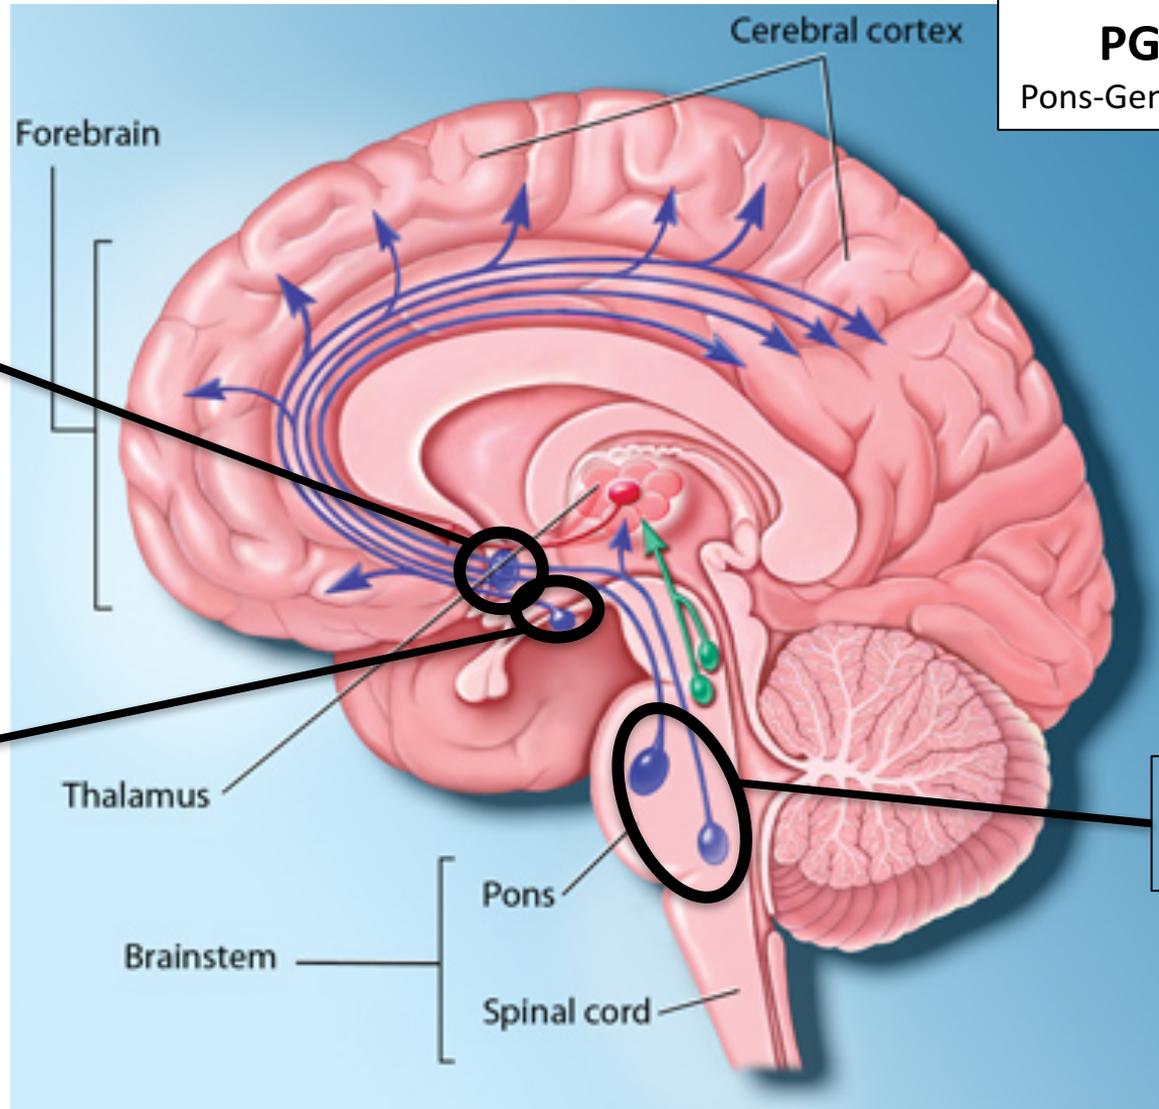

- Controversial!
- Sleep IS restorative
 - Engage in critical metabolic processes, process waste, etc
 - But, then why do some animals (e.g. prey) sleep only a few hours while others require so much more (e.g. predators) ?
- REM may have cognitive / psychological advantages
 - REM-deprived have poorer memory for previous day's learning
 - Dreams may be involved in helping to resolve psychological conflicts

Functions of Sleep & REM ???

- Controversial!
- Sleep IS restorative
 - Engage in critical metabolic processes, process waste, etc
 - But, then why do some animals (e.g. prey) sleep only a few hours while others require so much more (e.g. predators) ?
- REM may have cognitive / psychological advantages
 - REM-deprived have poorer memory for previous day's learning
 - Dreams may be involved in helping to resolve psychological conflicts
- Slow-Wave/REM cycle may also involve temperature regulation
 - Brain operates within a very narrow range of temperatures
 - Brain cools down during Slow-Wave sleep
 - REM warms brain (Poss why Hypothalamus triggers PGO wave?)

Regulating the Sleep Cycle

Plus
PGO Wave
Pons-Geniculate-Occipital

Hypohalamus:
VLPOA
(Vento-Lateral
Pre-Optic Area)
>> **Basal Forebrain**

Hypothalamus:
**Tubero-
Mammillary**

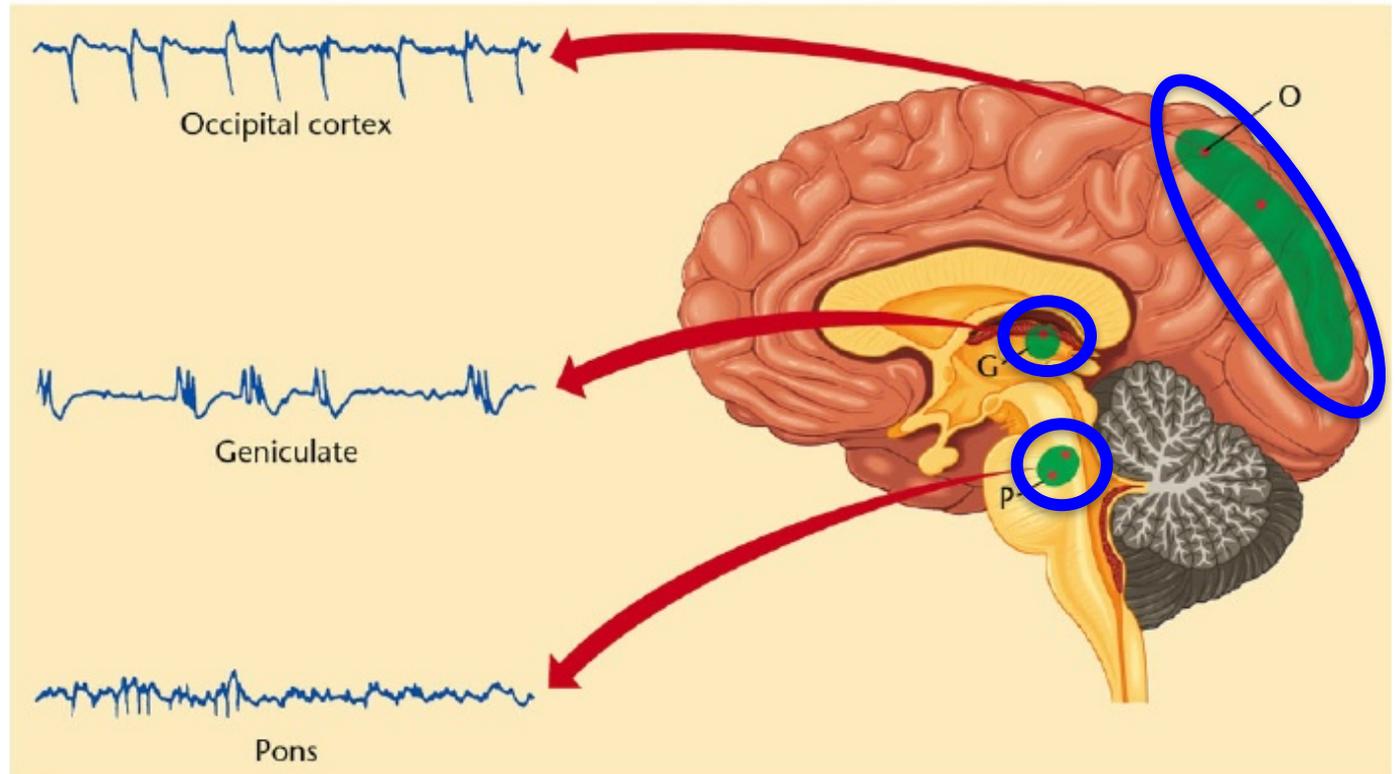

Raphe Nuclei
in medial Pons

REM – Initiated by PGO Waves

Then to
OCCIPITAL
(Visual) Cortex

Then to
Lateral Geniculate
of THALAMUS

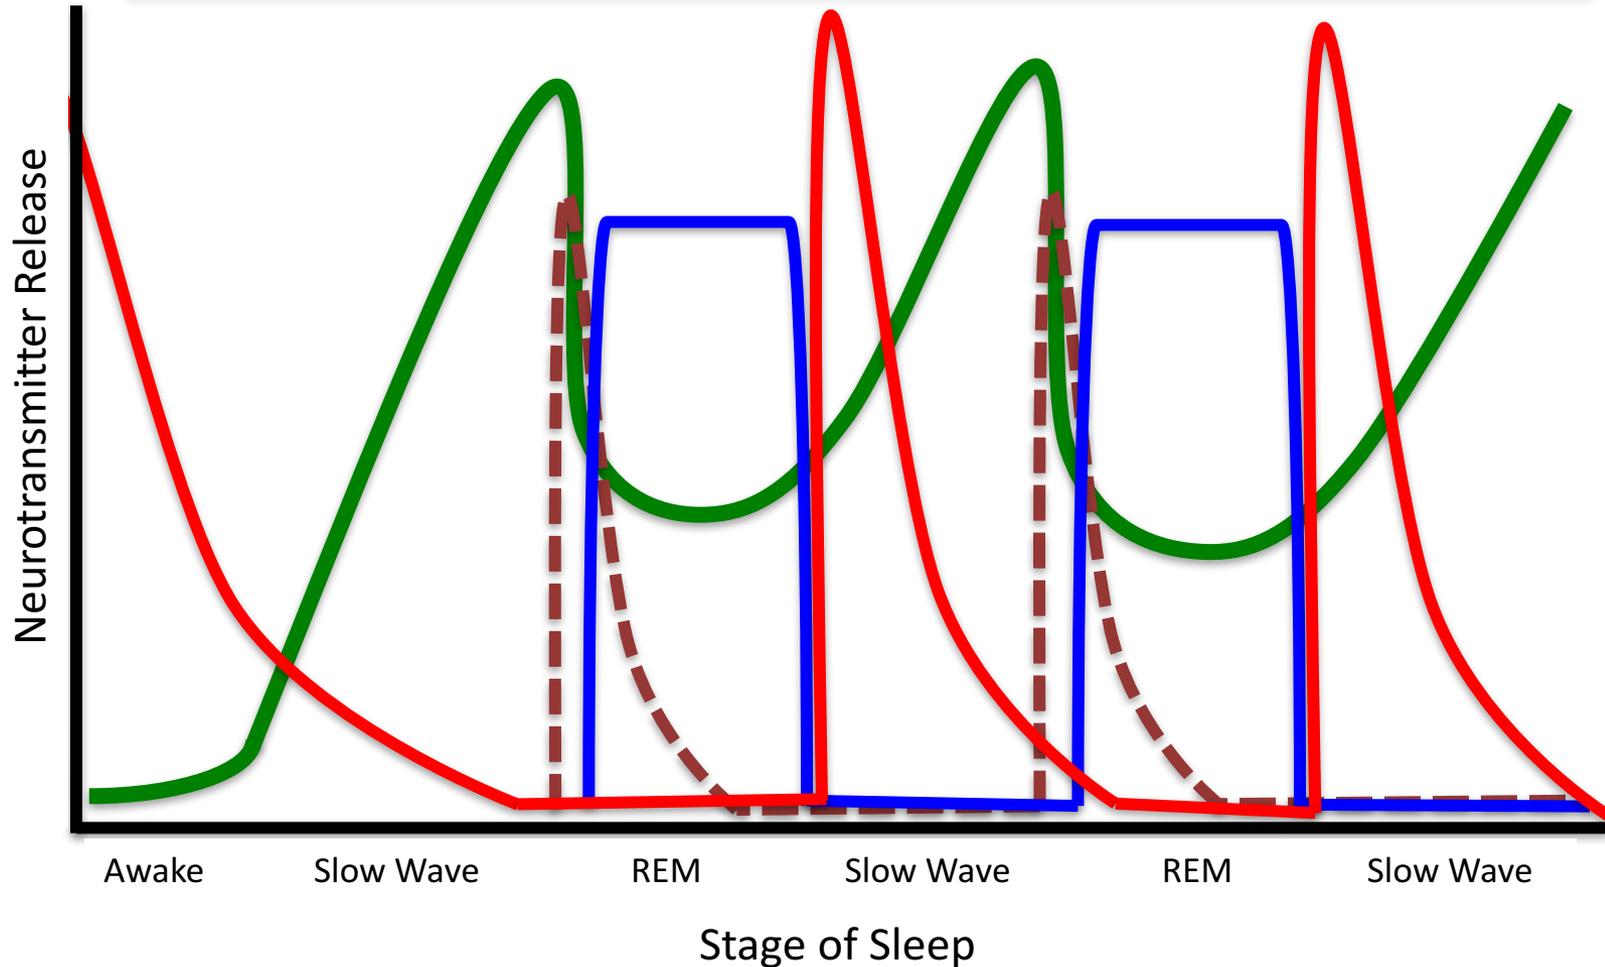

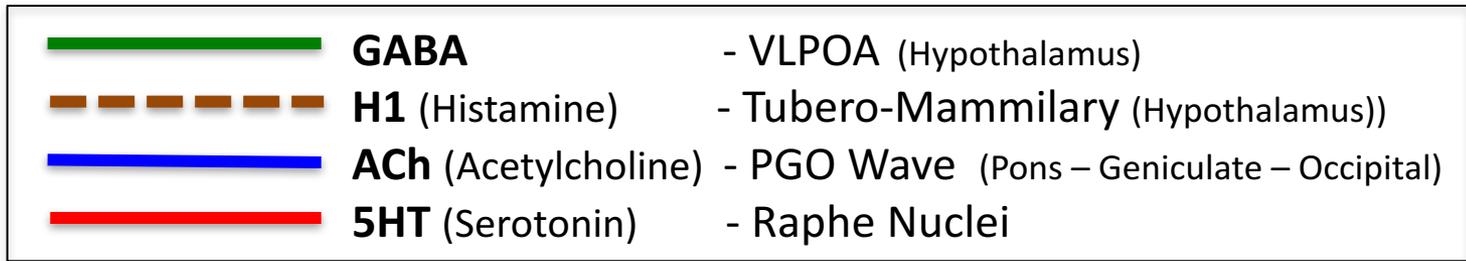

Activity begins in
PONS

REM

P → G → O

(Some) Neurotransmitters regulating Sleep Cycle

Circadium Rhythm

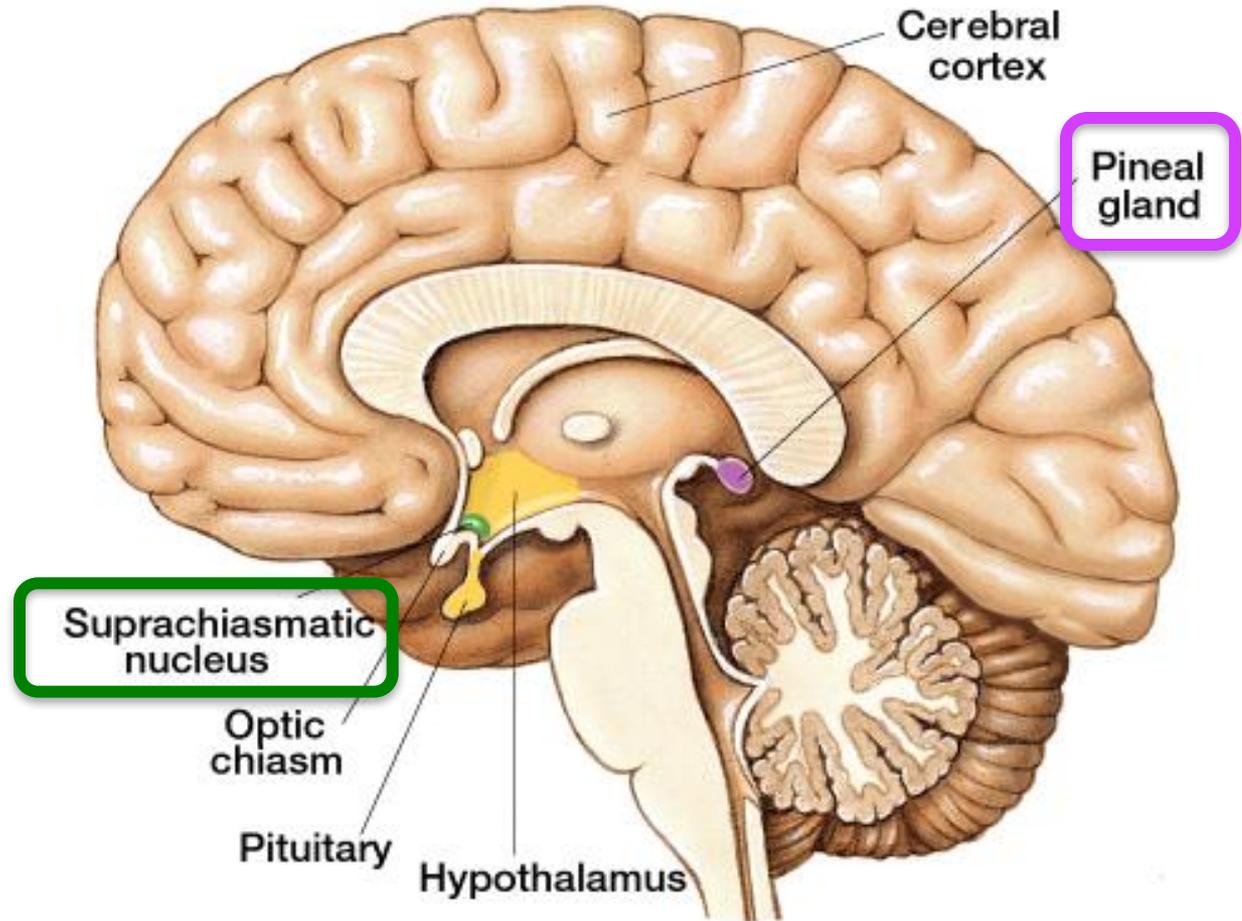

SCN

Suprachiasmatic Nucleus
of Hypothalamus

"Clock"
maintains a
24 +/- 1 hour
rhythm of activity

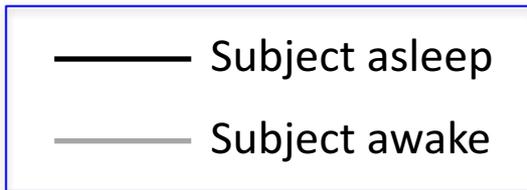

Virtually impossible to
disrupt this rhythm
in living cells

Apparently
genetically controlled

Interacts with **Pineal Gland** – see more below

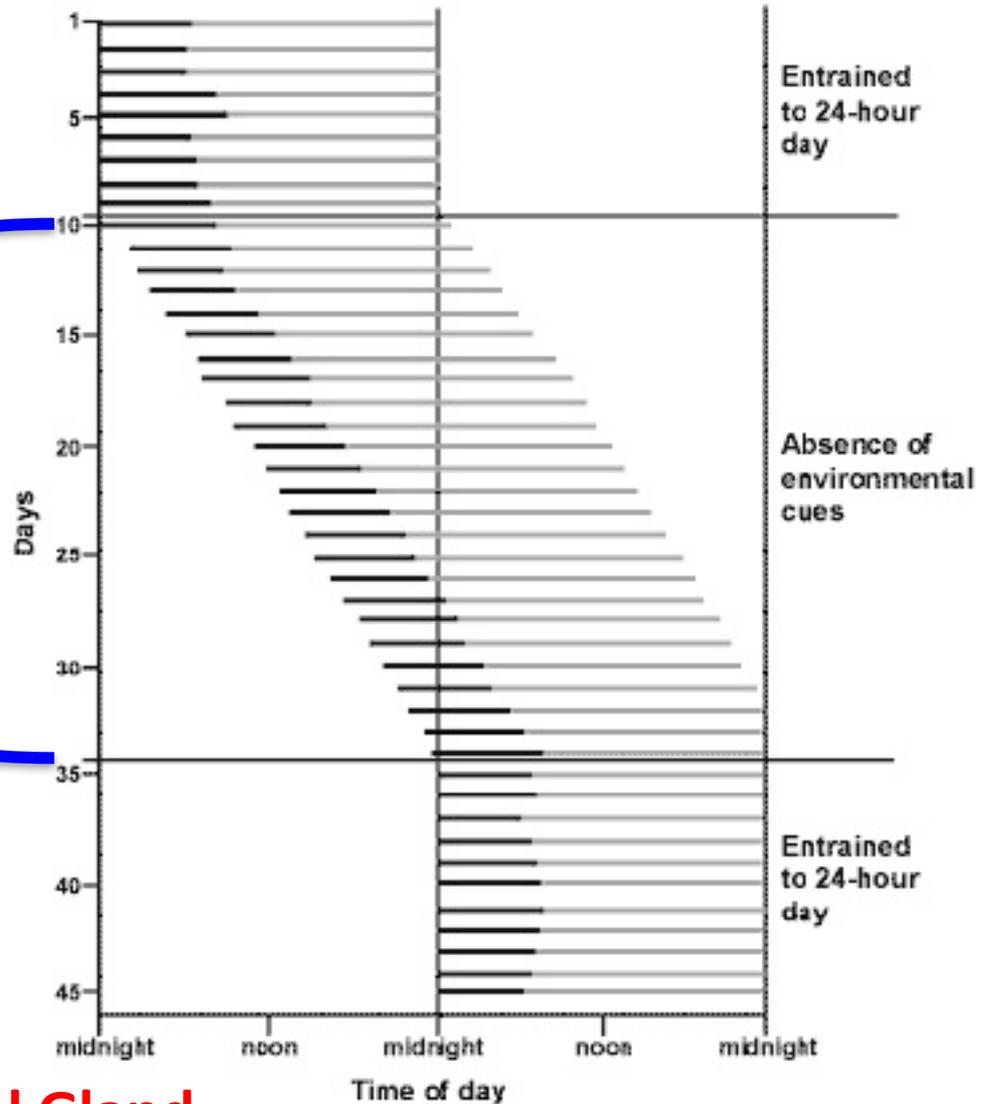

Circadium Rhythm

In the absence of Day/Night cues...
...subject maintains 24 \pm 1 hour rhythm...
...but cycle tends to **drift**

This flexibility allows creature to adapt to seasonal changes.

So, in addition to **SCN** clock, need a way to link it to time of day

"Zeitgeber" (Time Giver) = **Pineal Gland**

The Pineal Gland

"The Third Eye"

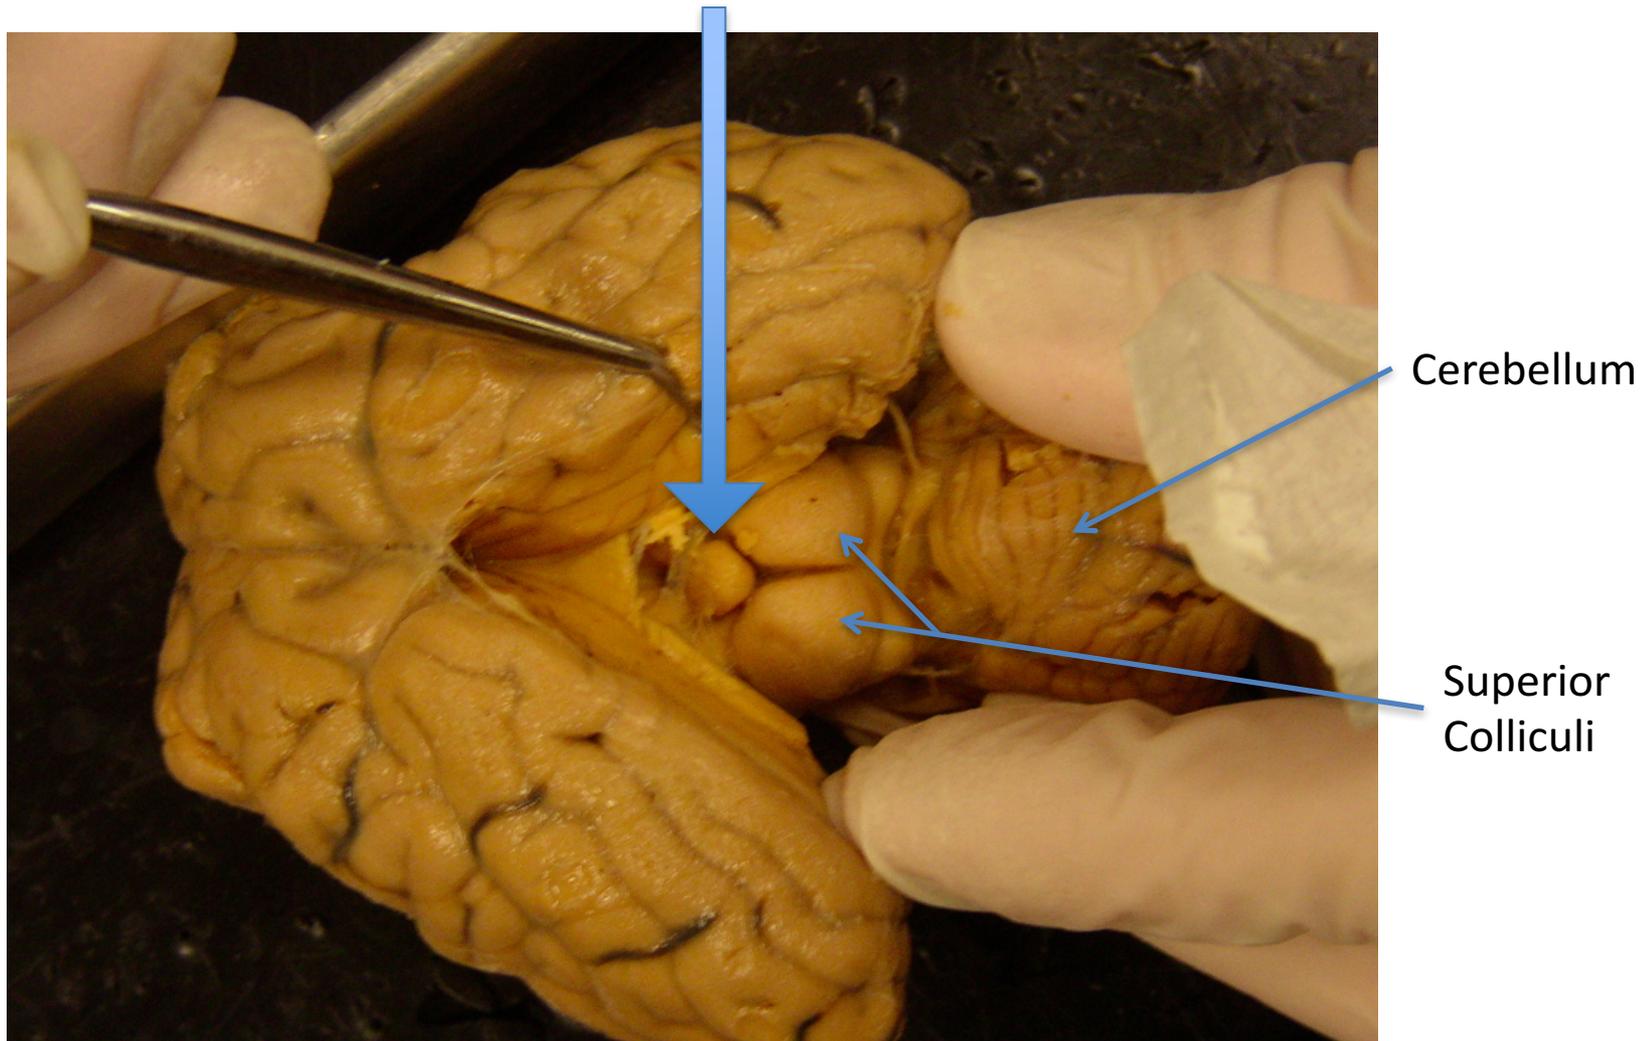

In some lizards & birds,
the **Pinal Gland**
(or specialized visual receptors to the Pineal Gland)
is a third eye!

While not exposed to the outside in humans,
it serves much the same function . . .

The Pineal Gland

Pineal gland releases **Melatonin** – promotes Sleep

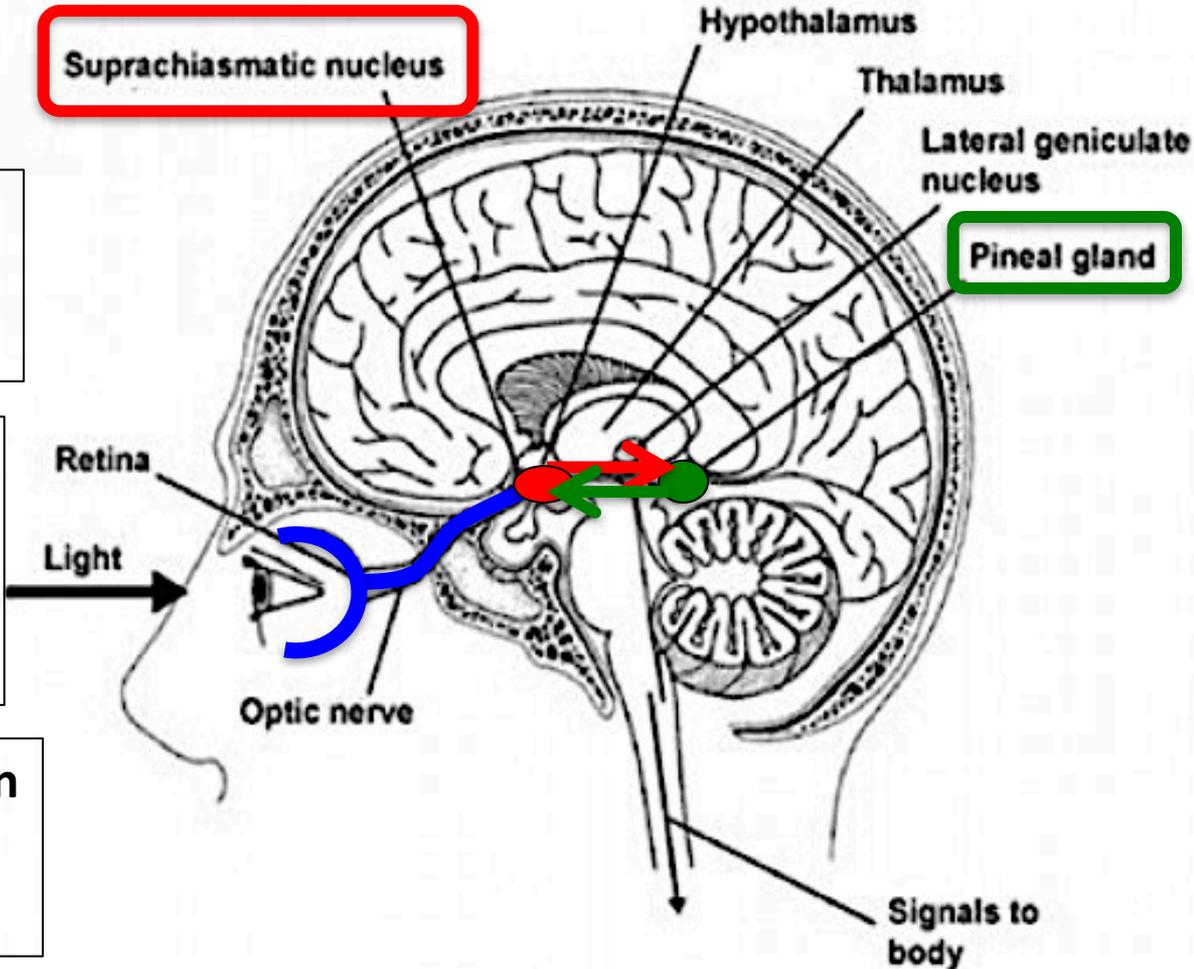

Retino-Hypothalamic Path

Specialized visual receptors
(ancient **Ganglion** cells,
with photopigment **Melanopsin**)
react to ambient light levels

These Ganglions send their axons
not to LGN, but to **SCN**
of Hypothalamus

SCN informs **Pineal Gland**,
so daylight decreases/
nightfall increases its release of
Melatonin

Pineal Gland releases **Melatonin**
inhibiting **SCN**
regulating its active/inactive cycle

NOTE – You can take Melatonin for jet-lag

Fly east, take about 1 hour before bed, promotes Pineal production of Melatonin, resets "clock"
