# Is Africa a linguistic area?

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- Some scholars have claimed that Africa as a whole can be considered a linguistic area
  - Heine and Leyew (2008): 11 “African” linguistic properties
  - Creissels et al. (2008): Africa forms a linguistic area based on morphosyntactic data
- Others reject the idea of Africa as a single linguistic area, but identify smaller linguistic areas on the continent
  - Güldemann (2008): The “Macro-Sudan Belt” is a linguistic area
  - Clements and Rialland (2008): Africa can be divided into 6 phonological areas
  - Creissels (2015): West Africa is a linguistic area based on morphosyntactic tone and other features.
- More detailed study of the linguistic geography of Africa is needed in order to identify both macro- and micro-areas (Heine and Nurse, 2008)

# Goals of this talk

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- Based on data from 243 tone systems and 74 vowel systems, we argue that Africa as a whole does not form a unified linguistic area
- Likewise, these data do not provide evidence for the Macro-Sudan Belt as a unified phonological area
- Instead, we find evidence for smaller linguistic micro-areas
  - South of Lake Chad
  - The Nigeria/Cameroon border
  - The Ghana/Togo/Burkina Faso cluster
  - The Kru/Mande Zone

# Areal Linguistic Features of Africa (ALFA) Project

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project

Tone database

Results

Tone

Vowel systems

Conclusion

References

- The ALFA Project is the work of 11 linguists at UC Berkeley
- We are gathering data on 7 linguistic features that have been claimed to be “African”
  - Tone
  - ATR systems
  - Nasal vowels
  - Syllable and word structure
  - Verb extensions
  - Serial verbs
  - S AUX O V
- For each feature, we have created a database of languages coded for key properties
- We created a web application to map the languages based on these properties to identify areal and genetic patterns

# Language mapper

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project

Tone database

Results

Tone

Vowel systems

Conclusion

References

- Language mapper (Ewert, 2015) is a web application
  - Input: spreadsheets of data, Glottolog language data (Hammarström et al., 2015)
  - Output: a Google map of language data letter-coded with genetic information and color-coded for linguistic features (Google, 2015)

# Tone database

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project

Tone database

Results

Tone  
Vowel systems

Conclusion

References

- We gathered tone data from a database of 662 tone languages (Hyman, 2015)
  - 243 African languages
- The data was recoded with a numerical system we designed to encode equivalencies across different traditions of representation
- Our coding allowed us to look at numerous features of tone inventories including:
  - Number and identity of level tones
  - Number and identity of downstepped tones
  - Number, direction, and identity of contour tones

# African languages by number of surface level tones

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

**Tone**  
Vowel systems

Conclusion

References

- Languages were coded by the number of non-contour tones in their surface tone inventories
- This count included downstepped tones as constituting a separate surface level
- The goal of this analysis was to separate languages based on the number of contrastive pitch levels they distinguish on the surface
- There are several micro-areas defined by the number of levels that languages distinguish in their surface tone inventories

# Number of surface level tones - Summary

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- Mande languages near Kru have more surface levels
- Bantoid languages near the Nigeria/Cameroon border have more levels than Bantu languages in southern Africa
- There are three areas of three level tones
  - Ghana/Togo/Burkina Faso
  - South of Lake Chad
  - Ethiopia/Sudan

# African languages with three surface level tones

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- As seen in the previous maps of number of surface level tones across African languages, the most common number of levels is 3, especially in the Macro-Sudan belt.
- The following maps show only those African languages which have exactly three level tones, differentiating them by which tones are in their inventories:
  - Low, Mid, High
  - Low, !High, High
  - Low, !Low, High
  - Low, High, Superhigh
- We recognize that which three levels a given language has is often a matter of analysis.

# Three surface level tones - Summary

Areal features

Hyman et al.

Introduction

Methodology

The ALFA

Project

Tone database

Results

Tone

Vowel systems

Conclusion

References

- Languages in Southern Africa have downstep.
- Bantoid languages nearer the Nigeria/Cameroon border are more likely to have a mid tone.
- Languages south of Lake Chad have a mid tone.

# African languages by number of surface contour tones

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- We have seen the distribution of surface level tones, and now we turn to surface contours.
- We find that high numbers of contour tones are found in the Kru/Mande zone of southern West Africa.
- There are also marked areas that lack contour tones entirely.

# Number of surface contour tones - Summary

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- There is a high concentration of numerous contour tones in the Kru/Mande-zone, but not in Mande languages further away.
- There are sporadic languages with high numbers of contours throughout the rest of the Macro-Sudan belt (cf. Central Sudanic).
- Bantoid languages on the Nigeria/Cameroon border tend to have more contours than Bantu languages in southern Africa
- There are two regions that lack contour tones entirely
  - Ghana/Togo/Burkina Faso
  - South of Lake Chad

# Are languages with a high number of level tones more likely to have a high number of contours?

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- The Ghana/Togo/Burkina Faso cluster is an area of 3-level tones that lacks contours
- Central Sudanic languages have 3 level tones and most have no contours
- The Kru/Mande zone has high numbers of level tones and contours

# African languages by direction of contour tones

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

**Tone**  
Vowel systems

Conclusion

References

- Here we are interested whether falling versus rising contour tones pattern together areally.
- We find little evidence that the direction of contours is an areal feature; however, the Kru/Mande zone is the only area where multiple languages show complex contours.

# Direction of surface contour tones

Areal features

Hyman et al.

Introduction

Methodology

The ALFA

Project

Tone database

# Direction of surface contour tones - Summary

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

**Tone**  
Vowel systems

Conclusion

References

- There is little evidence that falling versus rising contour tones are areally diffused.
- The Kru/Mande Zone is the only region with more than one language that has complex contours; this correlates with a high number of surface tones.

# African languages by surface downstepped tones

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- The final tonal feature we examine is the distribution of surface downstepped tones.
- We see a high concentration of downstep across the Macro-Sudan belt, with a break between central Cameroon and east South Sudan.
- Alternatively, we see two micro areas of downstep:
  - West Africa between Côte d'Ivoire and west Cameroon
  - East Africa between South Sudan and northern Rwanda/Kenya

# Surface downstepped tones - Summary

Areal features

Hyman et al.

Introduction

Methodology

The ALFA

Project

Tone database

Results

Tone

Vowel systems

Conclusion

References

- The highest concentration of downstep is in West Africa between Côte d'Ivoire and the Nigeria/Cameroon border.
- Bantoid languages on the Nigeria/Cameroon border have downstep while the Bantu languages in our database do not, showing evidence for the areal distribution of downstep in West Africa.
- Languages south of Lake Chad lack downstep
- Languages with many surface level tones and contours tend to lack downstep (Kru, Mande)

# Linguistic micro-areas based on tone

Project  
Tone database

## Results

Tone  
Vowel systems

## Conclusion

## References

- Proto-Mande is reconstructed with two level tones (Vydrin, 2002).
- Proto-Kru is reconstructed with four level tones (Marchese, 1979; Marchese Zogbo, 2012).
- We have seen that those Mande languages situated nearest to Kru have large tonal inventories, while those further north do not.
- These findings are consistent with Vydrin (2009), who shows the validity of the Mande/Kru Zone as a linguistic area based on multiple features, including the number of tone heights.

  - Mano - 3 (Kachaturyan, 2014)
  - Kpelle - 3 on the surface but only 2 phonemically (cf. Konoshenko 2011 for an overview)

# Further phonological evidence of micro-areas in Africa

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- Other phonological features that show preliminary evidence for micro-areas in Africa:
  - ATR harmony
  - Central vowels
  - Nasal vowels
  - Syllable and word structure

# Vowel features

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- 74 languages of the Macro-Sudan belt
- Coded for vowel inventory, nasality, ATR harmony
- Here we focus specifically on ATR systems and the inventory of 'interior' vowels
  - We define an ATR system as exhibiting an active harmony process
  - 'Interior' vowels are defined as central vowels, except /a/, and back unrounded vowels

# African languages by ATR and Interior Vowels

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- The literature is not in agreement about whether Proto-Niger-Congo had ATR harmony (cf. Dimmendaal 2001 for an overview)
- There is evidence for an area of the Macro-Sudan belt lacking ATR harmony
- With more data, we may find that those languages that lack ATR systems are more likely to have interior vowels, which are not reconstructed for Proto-Niger-Congo and thus are likely an innovation

# ATR and Interior Vowels - Summary

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- Many languages at the Nigeria/Cameroon border and south of Lake Chad have interior vowels but lack active ATR systems
- These data suggest a tendency toward a complementary distribution of vertical and horizontal expansions of vowel systems
- Future work will include adding more languages that exhibit ATR harmony to the database to investigate this hypothesis

# Nasal Vowels

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- Based on data from 473 languages, Rolle (2015) finds evidence for five micro areas in West Africa having only oral, not nasal, vowels
- Three of these micro areas match the micro areas that exhibit areal tonal patterns
  - Ghana/Togo/Burkina Faso cluster
  - South of Lake Chad
  - Nigeria/Cameroon border

# Syllable and word structure

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- Based on data from roughly 50 languages, Lamoureux and Lionnet (2015) find preliminary evidence for a micro area in the Kru/Mande Zone lacking codas
- The Nigeria/Cameroon border appears to be less restrictive with respect to possible codas

# Is Africa a linguistic area?

Areal features

Hyman et al.

Introduction

Methodology

The ALFA  
Project  
Tone database

Results

Tone  
Vowel systems

Conclusion

References

- We have found evidence for linguistic micro-areas including:
  - South of Lake Chad
  - The Nigeria/Cameroon border
  - The Ghana/Togo/Burkina Faso cluster
  - The Kru/Mande zone
- We do not find evidence for the Macro-Sudan Belt as a cohesive area with respect to tone and vowel systems

# Implications for reconstruction

## Areal features

Hyman et al.

## Introduction

## Methodology

The ALFA  
Project  
Tone database

## Results

Tone  
Vowel systems

## Conclusion

## References

- While certain phonological features are common in many areas across Africa, we find evidence for micro-areas rather than a widespread distribution of each feature
- The areal distribution of the features we have examined suggests innovation rather than conservation within families
- If these features have been independently innovated in multiple micro-areas, this could inform our typology regarding ease of innovation
