Cognitive Science 276 – Neuroimaging

Homework #2: Fourier Transform and Image Reconstruction

The goal of this homework is to learn learn basic concepts of 1-D and 2-D Fourier analyses in MATLAB, including forward and inverse Fourier transforms (FT) of signals in the spatial and frequency domains, amplitude and phase spectrums, sampling, image reconstruction, aliasing of images, and ghosts. (*Hint: matrix entries are conventionally identified by (row,column), which is up/down, then left/right, while pixels are conventionally identified by (x,y), which is left/right, then up/down)*.

1: 1-D FT. Plot the following 1-D functions and their amplitude spectra:

```
f_1(x) = cos(4*2\pi*x), \quad f_2(x) = 0.5*cos(13*2\pi*x), \quad and \quad f_3(x) = f_1(x) + f_2(x)
```

Qualitatively describe the spectrum of the first two functions and then the spectrum of their sum.

- **2: 1-D Inverse FT.** (this is a continuation of Problem 1). $F_I(f)$ is the spectrum of $f_I(x)$. Reconstruct a function $f'_I(x)$ from $F_I(f)$ using the inverse Fourier transform, ifft(). Plot the real and imaginary parts, and the amplitude and phase of $f'_3(x)$. using real(), imag(), abs(), and angle(). Explain why the imaginary and phase plots look funny. Now do the same for F_3 (use the spectrum, $F_3(f)$, to reconstruct $f'_3(x)$).
- 3: Spatial Shift. Plot the following 1-D functions and their amplitude and phase spectra. $f_1(x) = cos(3*2\pi*x), \quad f_2(x) = cos(3*2\pi*x + 0.2*2\pi), \quad f_3(x) = cos(3*2\pi*x + 0.5*2\pi)$ Briefly describe the correspondence between spatial and frequency domains, commenting on the relation between spatial shift and phase warp.
- 4: Display 2-D Image. Convert a 2-D tiff image into a matrix with: B=double(imread('tlsag.tiff'));
 Download 256x256 tiff (sagittal T1 brain image) from http://cogsci.ucsd.edu/~sereno/276/tlsag.tiff
 (other uncompressed, grayscale tiffs work, too). Plot it with: colormap gray; imagesc(B, [minB maxB]);
 axis square; Play with minB and maxB (don't forget the brackets). It autoscales if you omit the [minB maxB].
- 5: 2-D FT. Compute the 2-D Fourier transform of image B using F=fftshift(fft2(B)); Then make four plots of F (which is a 2-D matrix of complex numbers): first the real and imaginary components, and then the corresponding amplitude and phase components. Use the functions: real(), imag(), abs(), angle() and imagesc(Comp,[minComp maxComp]); You will have to experiment with the minimum and maximum values to make sense of the pictures. You can also use the functions min() and max() (apply them twice to operate on a matrix). Describe the resulting distribution of energy in spatial frequency space (k-space).

Hint (image and its amplitude spectrum plotted on one page):

6: K-space Center. Manipulate the amplitude of the center point of k-space: $F(k_{x_0}, k_{y_0})$, which in the present case can be referenced with F(129, 129) (N.B.: the coordinates given for the center of K-space assume fftshift() has *first* been applied). First *triple* the center point, reconstruct the images by using ifft2(fftshift()), plot the original and reconstructed (amplitude) image using the same maximums and minimums, and describe the result. Then do the same reconstruction after *zeroing* the center point.

- 7: **Spikes in K-space.** An individual data point in K-space is sometimes mistakenly assigned a very large value (e.g., as a result of someone turning on a light switch when that data point was being collected). Modify the following three K-space points by setting them to a large value (e.g., 5*10⁶), one at a time:
 - (a) F(129+8, 129)
 - (b) F(129, 129+16)
 - (c) F(129+8, 129+16)

Reconstruct the images in each case using ifft2(fftshift()) and plot and describe them.

- **8: Zero Portions of K-space.** By setting portions of K-space to zero, certain ranges of spatial frequency will be removed when the image is reconstructed. Set the following regions of K-space to zero, reconstruct the images as above, then plot K-space (amplitude) and the reconstructed image in each case, and comment on the result:
 - (a) set F(k(x),k(y)) = 0, when x is between 1 and 256, and y is between 129-32 and 129+32
 - (b) set F(k(x),k(y)) = 0, when y is between 129-32 and 129+32, and y is between 1 and 256
 - (c) set F(k(x),k(y)) = 0, where both x and y are between 129-32 and 129+32 (high pass)
 - (d) set F(k(x),k(y)) = 0, except where x and y are between 129-32 and 129+32 (low pass)

Hint: make blank mask using ones() or zeros(), set ranges of mask to 0 or 1 using low:high syntax, apply mask to K-space with element-wise operators (e.g., for multiplication: .*).

- **9: Subsample K-space.** If an *image* (or a time signal) is not sampled frequently enough, aliasing (wraparound) will occur in the *frequency* domain (that is, after a Fourier transform). This is also true when going from the *frequency* domain back to *space* (or time); that is, if *K-space* is not sampled frequently enough, aliasing will result in the *image* (or time) domain. Simulate this by zeroing K-space points:
 - (a) set every K-space point whose x coordinate has an even number to zero (zero even numbered K-space lines)
 - (b) set every K-space point whose y coordinate has an even number to zero (zero lines in other direction)
 - (c) apply the operation in (a) to the K-space result you got in (b) (undersample *both* directions)

Comment on the effect of these three different undersamplings after reconstructing the images with ifft2(fftshift()).

- **10: Shift Alternate Lines of K-space.** When K-space data is collected during an EPI scan, the even and odd lines may not be properly aligned because of imperfections of the gradients. Simulate this by shifting even K-space lines to the left and the odd K-space lines to the right:
 - (a) set F(k(x),k(y)) = F(k(x-1),k(y)), when y is odd and F(k(x+1),k(y)), when y is even
 - (b) set F(k(x),k(y)) = F(k(x-3),k(y)), when y is odd and F(k(x+3),k(y)), when y is even

Plot both K-space and reconstructed images for the above manipulations. How do these ghosts differ from the ones generated in the previous problem?

Hint: watch limits so you don't go off the edge
